# 1. Code Challenge

For the coding challenge, and after the talk we had on the phone I did not focus too much working on it, but I worked mostly for the second challenge.

Regarding the application I managed to set up the environment and have my widget running. Below there is an example of the intro page, showing an alert message when pressed.

The Post Page would return an empty page although I tried to present at least the form of it. From a little bit research I made, the "input" element would mess up with the front-end. Probably, some code may be required on typescript as well. Even with direct value specification on the InputForm the application would not work. Also, adding an "html-webpack-plugin", would not help.

The react-widget folder is provided.
